Weekly Progress Report

Name: **Tahrim Shafi Saudagar**

Domain: **Python Intern**

Date of submission: **15/03/2026**

Week Ending: 03

I. Overview

During Week 3 of my internship, I focused on improving the functionality and overall user experience of the File Organizer project. In Week 2, I successfully developed a graphical user interface (GUI) using Tkinter and connected it with the backend file organizing logic.

In this week, I worked on adding advanced features to make the application more interactive and informative for the user. The main goal was to enhance the usability of the program by providing real-time feedback and improving the visual design.

I implemented features such as a progress bar to show the file organizing process, a file counter to display the number of files processed, and improvements in the interface design including a dark mode theme. I also continued testing the application to ensure that all features work properly together.

II. Achievements

1. Implementation of Progress Bar

One of the key features added this week was a progress bar to show the status of the file organization process.

When the user clicks the **Organize Files** button, the progress bar starts updating as files are being processed. This gives the user a clear idea of how much work has been completed and how many files are left.

This feature improves the user experience by providing visual feedback instead of making the user wait without any information.

2. File Counter and Result Display

I added a file counter feature to display detailed information about the file organization process.

After the program runs, it shows:

- Total number of files processed
- Number of files successfully moved
- Number of files skipped (in case of duplicates)

This information is displayed on the interface, which helps the user understand the result of the operation clearly.

3. UI Improvement and Dark Mode Design

To make the application more visually appealing, I improved the design of the graphical interface.

I applied a **dark mode theme** which includes:

- Dark background color
- Styled buttons with different colors
- Clear and visible text
- Improved layout and spacing

These changes made the application look more professional and modern.

4. Code Improvement and Structure

During this week, I also improved the code structure to make it more organized and readable.

- Functions were properly separated for better understanding
- Reusable code structure was maintained
- Comments were added to explain important parts of the program

This will make future modifications easier and improve overall code quality.

5. Testing the Enhanced Application

After adding new features, I tested the program again with different folders to ensure everything works correctly.

The application was tested for:

- Proper progress bar updates
- Accurate file count display
- Correct file movement
- Smooth performance of the GUI

The program worked successfully and handled different file types without issues.

III. Challenges

While adding new features, I faced some challenges:

1. Progress Bar Synchronization

Initially, the progress bar was not updating correctly while processing files. It required proper linking with the loop that processes files.

2. Managing File Counts

Keeping track of moved and skipped files required additional logic in the program, which needed careful implementation.

3. UI Design Adjustments

Applying dark mode and improving the layout required multiple changes in colors and alignment to ensure everything looked clear and readable.

IV. Solutions Implemented

To solve these challenges:

- I connected the progress bar with the file processing loop and updated it step by step.
- I added counters in the code to track moved and skipped files accurately.
- I carefully selected colors for the dark mode theme to maintain visibility and readability.
- I tested the program multiple times to ensure all features work smoothly together.

These solutions helped improve both functionality and user experience.

V. Learning Resources

1. USC_TIA Platform

- Continued following internship guidelines and submission process.
- Reviewed project requirements and ensured progress is aligned with expectations.

2. Python Learning

- Learned how to implement **progress bars using Tkinter (ttk module)**
- Practiced updating GUI elements dynamically
- Improved understanding of event handling and GUI responsiveness

These learnings helped me successfully implement advanced features in the application.

VI. Next Week's Goals

1. USC_TIA Platform

- Continue submitting weekly reports on time
- Review final submission requirements

2. Python Project Development

For the final week, I plan to:

- Perform complete testing of the application
- Fix any remaining bugs or errors
- Optimize the code for better performance
- Prepare final project documentation
- Get the project ready for final submission

VII. Additional Comments

Week 3 was focused on improving the quality and usability of the File Organizer project. By adding features like a progress bar, file counter, and dark mode interface, the application became more interactive and user-friendly.

This week helped me understand how to enhance a basic project by adding useful features and improving the design. I also gained more confidence in handling GUI-based applications and improving code structure.

Overall, the project is now much more advanced compared to the initial version, and I am ready to complete the final stage in the next week.
